Act 4: 23 runs, 5176 interior points (D >= 5M) -- 3463 canonical (66.9%), 1428 other.
CLEAN FIT (canonical family, TOTAL-N axis, 3463 points, 8 rungs): alpha = 0.589, beta = 0.461, E = 1.964, R2 = 0.9960; the profile likelihood's compatible ALPHA range is [0.34, 0.82], which contains Chinchilla's 0.34 AND 0.50, so this ladder DISCRIMINATES BETWEEN NONE OF THEM.
E is an EXTRAPOLATED asymptote, not a measured entropy: the corpus's measured unigram entropy is 4.9946 nats. The WITHDRAWN fit (alpha = 0.445) describes the OTHER family: R2 = +0.996 on its 1428 points, -0.666 on the canonical points.
